1 - General information

1.1 To user

Thank you for choosing SUNRISE laser chiller.

Please read the manual thoroughly before operating the machine.

Please keep your manual, receipt, QC pass and warranty card for further use.

Don’t spoil any label on the machine so that you can enjoy our service.

Please contact your local dealer or our service center if you need any further help.

This manual is only apply in our standard model, only reference for customized model

1.2 Unpacking

Your chiller is packed in special carton package; please reserve the carton and other packing stuff before you can make sure chiller is running properly. If the chiller doesn’t work, the chiller could be replaced for a new one within 7 days after you receive the chiller. If you have found any damage in the delivery, please contact logistic company and your local dealer for submitting damage claim.

This sign marked all Safety related chapter in this manual, the sign marked on the machine is reminding for safety operation.

This sign means high voltage danger.

Please read all the instructions on safety notice and operation carefully.
2 - General Information

2.1 Content
Laser chiller operators manual

2.2 Product Introduction

2.2.1 Type Code Explanation

PH-LW 15-B L P /**

Product family

Usage: Water Chiller for Laser

Cooling Capacity × 0.1KW

Code for Client
With Flow Switch
Type of Pump:
S: Super High Lift Pump
H: High Lift Pump
L: Low Lift Pump
C: Side Exhausting
B: Back Exhausting
W: Water Cooling

Heat exchange:

NOTE: In case of no the above code, means the function is not provided.

2.2.2 Applications

Our chillers are equipped with digital display electronic temp. Controller, one key operation for varies settings and malfunction prompt function, other steps will be realized by memories automatically.

In order to optimize and improve cooling efficiency and performance, adjustable cooling system is also available for our chiller, which outstandingly prolonged the life time of the compressor and enhanced temp. Control Stability.

2.2.3 Product Characteristics

1. Compact design, convenient for installation and operation;
2. All refrigeration components are international brand, which can offer good and stable cooling effects. Automatically cooling and heating alternating, the display accuracy can reach ±0.1 °C, and temperature stability is ±0.3 °C ~ ±0.5 °C.
3. Use famous brand electric fan, which offers big air volume, low noise and long life.
4. The materials for the water cycling system are industry plastic, stainless pump, PVC connectors, which are rust resistant.
5. Equipped with flow switch which can output protect signal.
6. Equipped with high and low temperature alarm signals output, it can be normal open or normal close signal as options.
7. Use digital temperature controller which is designed by sunrise and produced by famous OEM manufacturer. One button operation, the machine runs by memory automatically.
Front/Top
1. Water tank Cover
2. Temp. Controller panel
3. Lock catch

Back
4. Water outlet
5. Water inlet
6. Drain
7. Signal wire hole
8. Wheel

7.2 Cooling system

**NOTE:** Water temp. stability is ±0.5℃, the max. ambient is 40℃; Watet temp. setting range from 5 to 25℃. The filter is made of polypropylene and the filtration hole is 5μm in diameter. Nominal working condition: Above technical parameter is based on ambient temp. 30℃, output water temp. 25℃. All the specifications are subject to revise without further Notice.
6 - Trouble shooting

6.1 System not working (No cooling or pump not working)
- Whether the power wire is connected to the socket
- Whether the power is ready
- Whether the power switch on the panel is on

6.2 Pump not working properly
- Check water level, whether the pump is pumping water or not.
- Check whether the motor of the pump is working
- Check whether the recirculation system is blocked

6.3 Pump insufficient pumping
- Please check whether the voltage is too low
- Please check whether the diameter of the pipe is too small
- Please check whether the fluid viscosity is too high
- Please check the connection tube carefully

6.4 Insufficient cooling or No cooling
- Please check whether the voltage is too high or too low
- Please check whether the air discharge side has been blocked
- Please check ambient temp., high ambient temp. will make the compressor halt for a short time.

Note: No filter

Solution for no error codes display

1. Insufficiency cooling:
   ① Please check whether the condenser radiator and air filter is dirty
   ② Whether the temp. of the installation site is too high and ventilation condition is bad
   ③ Slightly refrigerant leakage (E3 error has been reported yet)
   ④ Whether the chiller has exceeded its designed lifetime, replace a new compressor might be a solution

2. Unstable temperature:
   If the chiller is keeping chilling or the water temperature is keep rising, please check the voltage of power supply (Normal voltage range: 197-242V), since over-low voltage will make the cooling magnetic valve and bypass magnetic valve fail to alternate.

3. No water flow or low water flow:
   Please check below:
   Whether there’s air inside the water pump, check whether the filter under the water tank is blocked, whether the pump capacitor is working and the pump relay is closed.

5 - Maintenances

Required periodic maintenance

1. Condenser, vent hole, air filter
   Condenser, vent hole, air filter should keep clean and periodically inspect in order to optimize the performance of cooling

2. Pure water filter
   Please rinse and replace the filter periodically.

3. Liquid level
   Please check the water level periodically, the water level should be above the coil, water supplement is necessary if the water level is lower than the coil; please replace the water frequently based on the actual water condition. If the water flow is not normal, please press the red button on the water filter to discharge the air inside the water circuit. Please check whether the back water circuit is leakage and the water level is lower, when there’re bubbles in the soft tube and back water inlet.

4. Clean the air filter periodically
   The air filter could be removed easily from both sides, use gentle detergent to remove the dust, clean the filter with clean water, and fix the filter back after it’s dry.

3 - Installation and start up

3.1 Safety Notes

① Please ask our dealer or professional staff to install the chiller
   The person who installs the chiller must be certified by government recognized licensor, if the chiller was not installed properly, water leakage, fire, and wound, electric shock may occur.

② Take proper measures to prevent suffocation caused by refrigerant leakage
   If the machine is installed indoor, ventilation well could avoid of suffocation hazard caused by gas leakage.

③ Make sure the machine is properly grounded.
   Electric shock may occur if the machine is installed without grounded.

④ Don’t stretch anything into the equipment.
   The high speed fan will be damaged by foreign material.

⑤ In case of abnormal running appear, cut off the power, contact our local dealer for instructions.
   Fire hazard, electric shock etc. might occur if keep running the machine under abnormal conditions.

⑥ Don’t operate the machine with wet hands.
   Electric shock may occur.

⑦ Don’t repair the chiller by yourself
   In safety sake, please ask our dealer or a professional staff to repair it.

⑧ Don’t install the chiller in a flammable and explosive place

⑨ Neutral liquid and liquid whose gravity and heat transmission are similar with water are required, in order to protect the water pump, water with solid particles are not allowed.

⑩ When replace the liquid please note the pump can’t be run without water.

⑪ In cold areas, proper anti-freezing measures should be done.
3.2 Site requirements:
Ambient temperature and relative humidity (RH)
Our chiller suitable for install indoors, ambient temp. from 5°C to 35°C, RH less than 80% (No condensation).

Location
The chiller should be installed on solid horizontal surface, the closer to the laser equipment, the better cooling performance will achieve; keep the chiller off the heating source at least 4inch (1.4meters), such as heating tube and boiler.

Please install the chiller at place where drainage system is available in order to keep the installation place clean in case of any leakage occurs, please don’t install the chiller in erosive gas, humidity, dusty places or indoors with high temp.

Our chiller is equipped with wheel, which makes it easier for installation and operation; the front wheel could be locked to secure the unit. Avoid voltage drops by using properly grounded power outlets wired with 14 gauges or larger diameter wire. If possible, be close to the power distribution panel.

Using an extension cord may cause low line voltage problems, the voltage loss should be with 10% from the extension cord if this is inevitable.

The heating discharged by the fan is 1.4 times than the rated cooling capacity, so the air-draft and air discharge side shouldn’t be too close to wall. The air discharge side should reserve at least 0.8m, the installation site should ventilate well, the air-draft and air discharge volume of the site should be a bit large than the chiller, or use air-condition with larger cooling capacity than the heat discharge of the chiller to cool the installation site.

3.3 Power connection
Make sure the power wire rightly connected and current, frequency should be match with the requirements marked on the label which was pasted on the back of the chiller.

3.4 Connection accessories
Process pipeline
There are 2 inner thread interfaces for water pipe connection and water inlet and outlet adapter is designed for connecting the accessories and working pipeline.
In order to keep the working site clean and safe, please choose the right flexible tube and accessories based on the liquid temperature and required temp.
4. Press set button to enter function option, chosen option flashes, press set button to enter next level setting.

4.1 xx flashes, press up and down button to adjust value, 0.1°C for each press, press set button to switch.

4.2 Function select menu to enter admin setting interface

4.2.1 xx flashes, press up & down button, 1min for each press

4.2.2 High & low temp. Alarm flashes, press set button to switch

4.2.3 Temp. Compensation interface

4.2.4 Compressor delay switch, xx flashes up & down button, 1min for each press

4.2.5 Function view

Connecting of water bypass and accessories for water circulation.

Water inlet & outlet installation diagram:

1. First wrap 3-4 circles as shown above;
2. Strain the seal tape and twist around the connection 7-8 circles;

3. Stretch the seal tape to its normal width, then wrap the connection for 3-4 circles, tighten up the seal tape before installation; screw the connection gently in order to avoid PVC connection break.

3.5 Water supplement
Please add clean liquid in the water tank, the water level should be above the coil, then cover the water tank.

3.6 Closed loop system or bypass setting
Please connect the chiller with peripheral equipment, the liquid flow direction is determined by the way of connecting; liquid was pumped into chiller from inlet and pumped out from water outlet.

3.7 Start up
Cooling fluid
Choose proper cooling fluid
Notice: Cooling fluid which is safe, healthy, environment-friendly and compliance with our chiller is necessary; fluid which is erosive and inflammable is not allowed.

Warning: erosive and inflammable liquid is not allowed!!!

Warning: Anti-freezing liquid is necessary for operation under 8°C

Warning: Power off button can only turn the machine into standby

4 - Operation

4.1 Temp. Controller instruction

Function summary

- Up button (press to increase setting value, keep pressing to continuous increase)
- Enter system menu or switch setting option
- Down button (press to decrease setting value, keep pressing to continuous decrease)
- Power switch / save & return
  1. In all setting interface, the temp. controller will save current parameters and exit setting interface for 10sec without operation;
  2. If you want to change the setting when alarm is showing, press on/off button to shut down the output.
  3. Press Return/Power button to save and exit in any setting interface.
  4. Power off: Press Return/Power button for 3sec at any operation interface to halt system.

1. System on when power connects, initial interface show for 1.5sec.

2. Standby

System standby: water tank temp: xx°C
setting temp: xx°C
press power button to start system

3. System running

Thank you for using Sunrise water chiller, system is starting up, please waiting
